Cronbach Alpha

This script compute the interrater reliabilty between my labels and the annotators' labels

```
labels <- read.csv("~/phd_work/cognitive_distortion/important_data/emotions_history.csv", header = F, fi
mylab <- read.csv("~/phd_work/cognitive_distortion/important_data/twoM_newLabels2.csv", header = T, fill
#recode my label 1-> 2 , 2->1
mylab <- mylab[, c('id','negative_ny')]
mylab$negative_ny <- recode_factor(mylab$negative_ny, '1' = '2' , '2' = '1', '3' = '3' , '4'= '4', '5'=
```

```
mylab$negative_ny <- as.numeric(as.character(mylab$negative_ny))
names(labels) <- c('id','userid','label','time')
#remove duplicated entries. Duplicated entries need to be reanalyzed later
l <-  labels[!duplicated(labels$id),]
interCor <- merge(mylab, l, by='id')
cor.test(interCor$negative_ny,interCor$label)
```

```
##
##  Pearson's product-moment correlation
##
## data:  interCor$negative_ny and interCor$label
## t = 21.734, df = 762, p-value < 2.2e-16
## alternative hypothesis: true correlation is not equal to 0
